

PLACE in Texas

When studying the physical regions of Texas, we can break down the features of each region into five different parts.

P	Plants – What types of plants grow in this region? What kind of weather and soil do they need to flourish?
L	Landforms – Does the region have mountains, hills, forests, scrub or plains?
A	Area (Physical Environment) – How would you explain the overall physical environment of this area to a visitor?
C	Climate – What is the normal weather like for this particular region?
E	Earth (Soil) – What is the soil like in this region?

Understanding the properties of a region will help you understand how people live in that region and how they adapt to where they live!
